

OnCore 15.3 Navigation Configuration

OnCore's navigation menus have been updated. From the new main menu **(A)**, you can choose the menu categories and items you use most and add them to your Favorites Bar **(B)** by clicking the star.

When a user first logs in to OnCore 15.3, the Favorites Bar does not include any menu items. When you click the star next to a menu item, that menu item is then added to the Favorites Bar. If you add a menu category that has menu items underneath it, such as if you click the star for the Admin menu category, the menu appears in the Favorites Bar and contains its menu items underneath it. If you decide later that you don't want a menu item to appear on your Favorites Bar, locate it on the main menu and click the star icon again to clear it.

You can navigate through menus using your mouse or the using the keyboard; for the keyboard, use the arrow keys to move through menus, press the spacebar to mark a menu option as a favorite, and press the Escape key to close a menu. You can also rearrange your menu options to put them in the order that makes the most sense for your workflows.
